

## Press release

## CertControl

09/2001

### Real time certificate revocation

For the safety of critical corporate online transactions, SyTrust S.A. is introducing a comprehensively expanded OCSP-responder named "CertControl".

SyTrust CertControl enables rapid revocation of digital certificates and provides for a safe and efficient alternative for the use of CRL-technologies which are hard to manage. Central validity management, enhanced data protection, reduced network occupancy and detailed settlement are the special features of SyTrust CertControl. CertControl can be used on various platforms and is adjustable to specific customer requirements. CertControl has been realised as webserver plug-in and is therefore efficient and reasonably priced.

The use of the worlds most used Apache webserver technology allows for an operational reliability on various platforms which has been proven in customers' applications already. The combination of Apache webserver technology with latest crypto hardware further enables very high scalability.
